

ELTROMBOPAG OLAMINE tablets (Revolade®) for chronic immune (idiopathic) thrombocytopenic purpura (ITP)

The Pan Mersey Area Prescribing Committee recommends the prescribing of ELTROMBOPAG OLAMINE tablets (Revolade®) by Haematologists only, for chronic ITP in accordance with NICE TA293.

RED

NHS England have issued an [interim clinical commissioning policy](#) which recommends that romiplostim and eltrombopag are to be considered first line treatments for ITP rather than conventional treatments (such as steroids and immunoglobulin) for the duration of the COVID-19 pandemic.¹

NICE technology appraisal (TA293)² recommends ELTROMBOPAG OLAMINE tablets (Revolade®) as an option for treating chronic immune (idiopathic) thrombocytopenic purpura in adults, only if:

- their condition is refractory to standard active treatments and rescue therapies or
- they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

Eltrombopag is recommended only if the company provides it with the discount agreed in the patient access scheme.

These recommendations are not intended to affect treatment with eltrombopag that was started in the NHS before this guidance was published. People having treatment outside these recommendations may continue without change to the funding arrangements in place for them before this guidance was published, until they and their NHS clinician consider it appropriate to stop.

NICE TA293 was first published on 24th July 2013. It replaced NICE TA205 which was published in October 2010.

NICE updated the recommendations on 26th October 2018 because the marketing authorisation for eltrombopag now includes people who have not had a splenectomy. NICE agreed that the wording of the guidance should be amended without the need for a full review, and the guidance should be re-issued and transferred to the static list.

Overall, there is no new evidence likely to lead to change in the recommendations of the original guidance, but there is evidence to support extending the recommendations to include all people who have not had a splenectomy, and not just those for whom surgery is contraindicated, as per the previous wording.

A review is not needed because the existing recommendation is based on evidence for both patients who had and had not had splenectomy, and any new evidence supports the efficacy of the drugs regardless of whether patients have had a splenectomy.

Costing information – NICE do not provide any resource impact information. NICE concluded that the extension to the marketing authorisation does not affect the committee's conclusions on clinical and cost-effectiveness.

Note: Patients who are not eligible for treatment under this statement may be considered on an individual basis where their GP or consultant believes exceptional circumstances exist that warrant deviation from the rule of this policy. In this situation, follow locally defined processes.

ELTROMBOPAG OLAMINE tablets (Revolade®) for chronic immune (idiopathic) thrombocytopenic purpura (ITP)

Eltrombopag (Revolade) is also licensed for severe aplastic anaemia refractory to immunosuppressive therapy. NICE was unable to make recommendations on eltrombopag (Revolade) for severe aplastic anaemia refractory to immunosuppressive therapy because no evidence submission was received from Novartis, but will review this decision if the company decides to make a submission.³

There is a BLACK Pan Mersey policy statement for this indication.⁴
